

理解区块链结构和原理

1、浏览器区块链Demo

区块链的概念起源于比特币，其本质上是一个去中心化的数据库，是分布式数据存储、点对点传输（P2P）、共识机制、加密算法等计算机技术的新型应用模式（摘自百科）。

为了更好地形象地了解区块链的一些概念和结构组成，可以查看浏览器版的区块链Demo。

浏览器版区块链Demo

通过该Demo，可以深刻地理解区块链、创世区块、时间戳、哈希、区块链哈希计算、前继哈希、挖矿、NONCE随机数、添加有效区块、P2P网络、节点、51%攻击等相关概念（需要点英文理解能力）

2、安装命令行工具Blockchain CLI

除了浏览器，还可以通过安装一个区块链Demo的命令行工具来理解区块链结构组成。

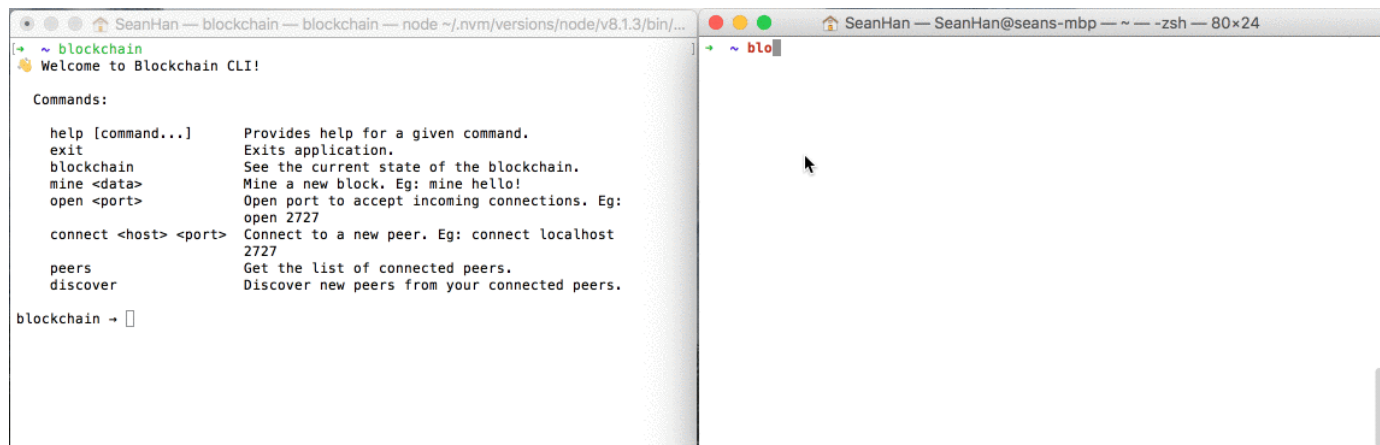

将本篇单独分拆成一个文档的主要原因是，安装这个工具的时候，遇到了一个坑，发现安装不了。尝试了多个方法，结果都一样。该Demo有十个月左右没更新了，在Issue讨论区别人也碰到了一些错误，安装不了。后面，演示一下问题所在和最后解决的方法。

- 安装前准备

Github地址：

<https://github.com/seanjameshan/blockchain-cli>

上图来自Github作者的图片

安装有个前提，就是确保已经安装了Node.js（包含npm）。

可以先通过终端检查安装情况：

```
wenzildeiMac:~ wenzil$ npm -v
3.10.10
wenzildeiMac:~ wenzil$ node -v
v6.9.5
```

如果没有安装Node.js，可以通过如下网址下载对应的安装包，安装比较简单：

<https://nodejs.org/en/download/>

安装方法一：官网介绍，然后执行如下命令

```
# Clone this repository
$ git clone https://github.com/seanseany/blockchain-cli

# Go into the repository
$ cd blockchain-cli

# Install dependencies
$ npm install
```

```
# Run the app
$ npm start
```

安装方法二：通过在终端执行如下命令来安装：

```
npm install blockchain-cli -g
```

- 安装问题描述

方法一跟方法二可能都会碰到安装不了的问题，问题都是相同的。以下以Git安装为例，演示下问题。

```
wenzildeiMac:Blockchain wenzil$ git clone https://github.com/seanjameshan/blockchain-cli.git
Cloning into 'blockchain-cli'...
remote: Counting objects: 510, done.
^Cceiving objects: 33% (169/510), 76.01 KiB | 36.00 KiB/s
wenzildeiMac:Blockchain wenzil$ cd ..
wenzildeiMac:study wenzil$ git clone https://github.com/seanjameshan/blockchain-cli.git
Cloning into 'blockchain-cli'...
remote: Counting objects: 510, done.
remote: Total 510 (delta 0), reused 0 (delta 0), pack-reused 510
Receiving objects: 100% (510/510), 3.00 MiB | 129.00 KiB/s, done.
Resolving deltas: 100% (276/276), done.
wenzildeiMac:study wenzil$ cd blockchain-cli
wenzildeiMac:blockchain-cli wenzil$ npm install
npm WARN deprecated formatio@1.2.0: This package is unmaintained. Use @sinonjs/formatio instead

> fsevents@1.2.4 install /Users/wenzil/Desktop/study/blockchain-cli/node_modules/fsevents
> node install

[fsevents] Success: "/Users/wenzil/Desktop/study/blockchain-cli/node_modules/fsevents/lib/binding/Release/node-v48-darwin-x64/fse.node" already installed
Pass --update-binary to reinstall or --build-from-source to recompile

> wrtc@0.0.62 install /Users/wenzil/Desktop/study/blockchain-cli/node_modules/wrtc
> node-pre-gyp install --fallback-to-build
node-pre-gyp ERR! Tried to download(undefined): https://node-webrtc.s3.amazonaws.com/wrtc/v0.0.62/Release/node-v48-darwin-x64.tar.gz
node-pre-gyp ERR! Pre-built binaries not found for wrtc@0.0.62 and node@6.9.5 (node-v48 ABI, unknown) (falling back to source compile with node
```

-gyp)

ACTION Downloading WebRTC libraries and headers third_party/webrtc

```
> wrtc@0.0.62 download-webrtc-libraries-and-headers /Users/wenzil/Desktop/study/blockchain-cli/node_modules/wrtc  
> node scripts/download-webrtc-libraries-and-headers.js
```

Attempting to download WebRTC libraries and headers for platform "darwin" and architecture "x64" from

<https://webrtc-libraries-and-headers.s3.amazonaws.com/v1/build/webrtc-50%2B49f7bd3.darwin.x64.tar.gz>

^Cmake: *** [third_party/webrtc] Interrupt: 2

碰到的问题：

- 1、可能一直卡在"node-pre-gyp install --fallback-to-build"这一步，网上也有对应的解决方案，但是好像没有效果；
- 2、可能一直卡在上面这一步，一直在尝试下载"...darwin.x64.tar.gz"的文件；
- 3、重新安装不同的Node.js版本，也是一样有问题。

一直卡着不动的话，在Mac下可以按"Control+C"中断下载，如上图后面中断了。尝试了多种方法，都是失败，一度放弃。

- 解决安装问题

在百度中，无意发现了这个网站。

<http://npm.taobao.org/package/blockchain-cli>

里面有个很显眼的地方，写着如下一段命令：

```
$ cnpm install blockchain-cli
```

于是，就开始安装cnpm

```
sudo npm install -g cnpm --registry=https://registry.npm.taobao.org
```

```
wenzildeiMac:~ wenzil$ cnpm install blockchain-cli -g  
Downloading blockchain-cli to /Users/wenzil/.npm/versions/node/v6.9.5/lib/node_modules/blockchain-cli_tmp  
Copying /Users/wenzil/.npm/versions/node/v6.9.5/lib/node_modules/blockchain-cli_tmp/_blockchain-cli@1.0.5@blockchain-cli to /Users/wenzil/.npm/v
```

```

```

- 使用Blockchain CLI:
安装成功后，在终端中输入"blockchain"命令

```
wenzildeiMac:~ wenzil$ blockchain
```

👋 Welcome to Blockchain CLI!

Commands:

help [command...]	Provides help for a given command.
exit	Exits application.
blockchain	See the current state of the blockchain.
mine <data>	Mine a new block . Eg: mine hello!
open <port>	Open port to accept incoming connections. Eg: open 2727
connect <host> <port>	Connect to a new peer. Eg: connect localhost 2727
peers	Get the list of connected peers.
discover	Discover new peers from your connected peers.

```
blockchain →
```

然后在"blockchain →"后面输入"blockchain"或者"bc"查看创世区块的结构

```
blockchain → bc
```

🏆 Genesis Block		
⏮	Previous Hash	0
📅 17	Timestamp	Thu, 27 Jul 2017 02:30:00 GMT
📄	Data	Welcome to Blockchain CLI!
🔥	Hash	0000018035a828da0...
🔨	Nonce	56551

```
blockchain →
```

然后输入"mine wenzil", 进行模拟挖矿

```
blockchain → mine wenzil
```

💰 Mining **new** block.

💰 Block #1		
⏮	Previous Hash	0000018035a828da0...

 17	Timestamp	Wed, 16 May 2018 08:02:12 GMT
	Data	wenzil
	Hash	0000a632fdcbfdee6...
	Nonce	43137

Congratulations! A **new** block was mined. 

Sending peer latest block

哈希值是唯一标识数据的固定长度的数值(十六进制64位)。

Hash是通过将Index、Previous Hash、Timestamp、Data和Nonce作为输入值来计算的。

```
CryptoJS.SHA256(index + previousHash + timestamp + data + nonce)
```

注：CryptoJS (crypto.js)为JavaScript提供了各种各样的加密算法，支持的算法包括MD5、AES、SHA-1、SHA-256等等

举例（blockchaindemo的例子，看最前面第一图）：

$f(\text{index} + \text{previous hash} + \text{timestamp} + \text{data} + \text{nonce}) = \text{hash}$

于是有了

$f(0 + "0" + 1508270000000 + \text{"Welcome to Blockchain Demo 2.0!"} + 604) =$
 000dc75a315c77a1f9c98fb6247d03dd18ac52632d7dc6a9920261d8109b37cf

打开如下网址，作验证：

<https://anders.com/blockchain/hash.html>

Tokens

Coinbase

SHA256 Hash

Data:

001508270000000Welcome to Blockchain Demo 2.0!604

Hash:

000dc75a315c77a1f9c98fb6247d03dd18ac52632d7dc6a9920261d8109b37cf

是不是发现跟刚才推导出来的哈希值一模一样，很神奇的赶脚，哈哈。

上述举例中对应的JS代码如下：

```
// const Block = require("./Block.js");
const crypto = require("crypto");

// class Blockchain {
//   constructor() { ... }
//   get() { ... }
//   get latestBlock() { ... }
//   isValidHashDifficulty(hash) { ... }

  calculateHashForBlock(block) {
    const { index, previousHash, timestamp, transactions, nonce } = block;
    return this.calculateHash(
      index,
      previousHash,
      timestamp,
      transactions,
      nonce
    );
  }

  calculateHash(index, previousHash, timestamp, data, nonce) {
    return crypto
      .createHash("sha256") // SHA256 Hash Function
      .update(index + previousHash + timestamp + data + nonce)
      .digest("hex");
  }
// };

// module.exports = Blockchain;
```

四个前导0是一个有效Hash的最低要求，所需前导0的数量被称为难度，也被称为工作量证明（PoW）。验证有效哈希难度的JS代码如下：

```
function isValidHashDifficulty(hash, difficulty) {
  for (var i = 0, b = hash.length; i < b; i++) {
    if (hash[i] !== '0') {
      break;
    }
  }
  return i >= difficulty;
}
```
